CHAPTER 13 | Monopolistic Competition: The Competitive Model in a More Realistic Setting

Chapter Summary and Learning Objectives

13.1 Demand and Marginal Revenue for a Firm in a Monopolistically Competitive Market (pages 432–434)

Explain why a monopolistically competitive firm has downward-sloping demand and marginal revenue curves. A firm competing in a monopolistically competitive market sells a differentiated product. Therefore, unlike a firm in a perfectly competitive market, it faces a downward-sloping demand curve. When a monopolistically competitive firm cuts the price of its product, it sells more units but must accept a lower price on the units it could have sold at the higher price. As a result, its marginal revenue curve is downward sloping. Every firm that has the ability to affect the price of the good or service it sells will have a marginal revenue curve that is below its demand curve.

13.2 How a Monopolistically Competitive Firm Maximizes Profit in the Short Run (pages 434–437)

Explain how a monopolistically competitive firm maximizes profit in the short run. A monopolistically competitive firm maximizes profits at the level of output where marginal revenue equals marginal cost. Price equals marginal revenue for a perfectly competitive firm, but price is greater than marginal revenue for a monopolistically competitive firm. Therefore, unlike a perfectly competitive firm, which produces where \( P = MC \), a monopolistically competitive firm produces where \( P > MC \).

13.3 What Happens to Profits in the Long Run? (pages 437–443)

Analyze the situation of a monopolistically competitive firm in the long run. If a monopolistically competitive firm is earning economic profits in the short run, entry of new firms will eliminate those profits in the long run. If a monopolistically competitive firm is suffering economic losses in the short run, exit of existing firms will eliminate those losses in the long run. Monopolistically competitive firms continually struggle to find new ways of differentiating their products as they try to stay one step ahead of other firms that are attempting to copy their success.

13.4 Comparing Monopolistic Competition and Perfect Competition (pages 443–445)

Compare the efficiency of monopolistic competition and perfect competition. Perfectly competitive firms produce where price equals marginal cost and at minimum average total cost. Perfectly competitive firms achieve both allocative and productive efficiency. Monopolistically competitive firms produce where price is greater than marginal cost and above minimum average total cost. Monopolistically competitive firms do not achieve either allocative or productive efficiency. Consumers face a trade-off when buying the product of a monopolistically competitive firm: They are paying a price that is greater than marginal cost, and the product is not being produced at minimum average cost, but they benefit from being able to purchase a product that is differentiated and more closely suited to their tastes.
13.5  How Marketing Differentiates Products (pages 445–446)

*Define marketing and explain how firms use marketing to differentiate their products.* Marketing refers to all the activities necessary for a firm to sell a product to a consumer. Firms use two marketing tools to differentiate their products: Brand management and advertising. **Brand management** refers to the actions of a firm intended to maintain the differentiation of a product over time. When a firm has established a successful brand name, it has a strong incentive to defend it. A firm can apply for a **trademark**, which grants legal protection against other firms using its product’s name.

13.6  What Makes a Firm Successful? (pages 446–449)

*Identify the key factors that determine a firm’s success.* A firm’s owners and managers control some of the factors that determine the profitability of the firm. Other factors affect all the firms in the market or are the result of chance, so they are not under the control of the firm’s owners. The interactions between factors the firm controls and factors it does not control determine its profitability.

**Chapter Review**

**Chapter Opener:** Starbucks: The Limits to Growth through Product Differentiation (page 431)

Since the first Starbucks coffee shop opened in 1971, the firm has grown into a worldwide company. Starbucks sells a differentiated product. Their coffeehouses are designed to provide a unique experience for their customers. But it is not difficult for other coffeehouses to copy the Starbucks approach. By 2009, fierce competition and a weak economy led Starbucks to close hundreds of stores and cut prices. In 2010, Starbucks became profitable again, partly due to expansion of its overseas markets. Starbucks, just as many other firms in monopolistic competition, faces a constant challenge to stay ahead of its competitors and satisfy its customers so that it stays profitable.

**13.1  Demand and Marginal Revenue for a Firm in a Monopolistically Competitive Market (pages 432–434)**

*Learning Objective:* Explain why a monopolistically competitive firm has downward-sloping demand and marginal revenue curves.

**Monopolistic competition** is a market structure in which barriers to entry are low and many firms compete by selling similar, but not identical, products. Because their products are differentiated, monopolistically competitive firms can raise their prices without losing *all* their customers. A price increase will, however, cause *some* customers to switch to another similar product, so a monopolistically competitive firm faces downward-sloping demand and marginal revenue curves. Monopolistically competitive firms have only limited control over their prices because they face competition from many firms selling similar products.
Study Hint

Spend some time studying Figure 13.3 on page 434 in the textbook to aid in your understanding of the downward-sloping demand and marginal revenue curves that a monopolistically competitive firm faces. For a monopolistically competitive firm, there is no guarantee lower prices will increase quantity demanded enough to raise revenue. When a decrease in price raises revenue, marginal revenue is positive. This is where the marginal revenue curve lies above the x-axis. When a decrease in price reduces revenue, marginal revenue is negative. This is where the marginal revenue curve falls below the x-axis.

Extra Solved Problem 13.1
Supports Learning Objective 13.1: Explain why a monopolistically competitive firm has downward-sloping demand and marginal revenue curves.

Suppose that the following table represents the demand for pizza at Luigi’s Italian Restaurant. Use this table to answer the questions below.

<table>
<thead>
<tr>
<th>Price</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>$26</td>
<td>30</td>
</tr>
<tr>
<td>24</td>
<td>60</td>
</tr>
<tr>
<td>22</td>
<td>90</td>
</tr>
<tr>
<td>20</td>
<td>120</td>
</tr>
<tr>
<td>18</td>
<td>150</td>
</tr>
<tr>
<td>16</td>
<td>180</td>
</tr>
<tr>
<td>14</td>
<td>210</td>
</tr>
<tr>
<td>12</td>
<td>240</td>
</tr>
<tr>
<td>10</td>
<td>255</td>
</tr>
</tbody>
</table>

a. What is Luigi’s marginal revenue?

b. Is Luigi’s a perfectly competitive firm or a monopolistically competitive firm? Explain.

Solving the Problem

Step 1: Review the chapter material.
This problem is about demand and marginal revenue, so you may want to review the section “Demand and Marginal Revenue for a Firm in a Monopolistically Competitive Market,” which begins on page 432 in the textbook.
Step 2: Answer question (a) by calculating Luigi’s marginal revenue.
To calculate marginal revenue, first find total revenue by multiplying the price by the quantity demanded at that price. Then calculate the marginal revenue by dividing the change in total revenue by the change in quantity. For example, at a price of $22, total revenue is: $22 \times 90 = $1,980. If Luigi cuts his price from $22 to $20, then his marginal revenue equals: 
\[
\frac{($2,400 - $1,980)}{(120 - 90)} = $14.
\]

<table>
<thead>
<tr>
<th>Price</th>
<th>Quantity</th>
<th>Total Revenue</th>
<th>Marginal Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>$26</td>
<td>30</td>
<td>$ 780</td>
<td>—</td>
</tr>
<tr>
<td>24</td>
<td>60</td>
<td>1,440</td>
<td>$22</td>
</tr>
<tr>
<td>22</td>
<td>90</td>
<td>1,980</td>
<td>18</td>
</tr>
<tr>
<td>20</td>
<td>120</td>
<td>2,400</td>
<td>14</td>
</tr>
<tr>
<td>18</td>
<td>150</td>
<td>2,700</td>
<td>10</td>
</tr>
<tr>
<td>16</td>
<td>180</td>
<td>2,880</td>
<td>6</td>
</tr>
<tr>
<td>14</td>
<td>210</td>
<td>2,940</td>
<td>2</td>
</tr>
<tr>
<td>12</td>
<td>240</td>
<td>2,880</td>
<td>$-2$</td>
</tr>
<tr>
<td>10</td>
<td>270</td>
<td>2,700</td>
<td>$-6$</td>
</tr>
</tbody>
</table>

Step 3: Answer question (b) by determining whether this is a monopolistically or perfectly competitive firm.
To determine whether Luigi’s is a perfect competitor or a monopolistic competitor, consider its marginal revenue. A perfectly competitive firm faces a horizontal demand curve that is also its marginal revenue curve, while a monopolistically competitive firm faces downward-sloping demand and marginal revenue curves. The marginal revenue in the table above decreases as the quantity increases, so Luigi’s is a monopolistically competitive firm.

13.2 How a Monopolistically Competitive Firm Maximizes Profit in the Short Run (pages 434–437)
Learning Objective: Explain how a monopolistically competitive firm maximizes profit in the short run.

As with firms in other markets, a monopolistically competitive firm will maximize profits by producing the level of output where marginal revenue (MR) is equal to marginal cost (MC). Because the MR curve lies below the firm’s demand curve, the firm will maximize profits where price (P) exceeds MC:

\[ P > MC \]

Like firms in perfectly competitive industries, profit is calculated as total revenue minus total cost. When measuring profit on a graph,

\[ \text{Profit} = (P - ATC) \times Q \]

As with competitive markets, if the price is greater than average total cost, profit is positive. When price is less than average total cost, profit is negative.
Study Hint
Review the table and graphs in Figure 13.4 on page 435 in the textbook for an example of a monopolistically competitive firm that makes a profit in the short run. Notice that the profit-maximizing quantity is where $MR = MC$, but the price the firm charges is determined by the demand curve. This implies that, unlike a perfectly competitive firm, a monopolistically competitive firm produces where price is greater than marginal cost.

What Happens to Profits in the Long Run? (pages 437–443)
Learning Objective: Analyze the situation of a monopolistically competitive firm in the long run.

When firms in a monopolistically competitive market are earning economic profits, entrepreneurs have an incentive to enter the market and establish new firms. As a result of this entry of new firms, the demand curve of an established firm shifts to the left and becomes more elastic. Entry will continue until the typical firm’s demand curve is tangent to its $ATC$ curve. In the long run, the typical firm’s price will equal its average total cost, and the firm will break even.

Economic losses will lead some firms to exit the market. As a result, the demand curve for a firm remaining in the market shifts to the right and becomes less elastic. The exit of firms continues until the typical firm can charge a price equal to its average total cost. In the long run, firms that remain in the industry will experience zero economic profit.

Study Hint
See Figure 13.5 on page 438 in the textbook for an illustration of how the entry of competing firms eliminates positive profits in the long run. In perfectly competitive markets, positive profits encourage entry and market supply shifts to the right as a result. In monopolistically competitive markets, positive profits still encourage firms to enter the market, but entry affects each firm’s demand curve by shifting demand to the left and making demand more elastic (flatter).

Comparing Monopolistic Competition and Perfect Competition (pages 443–445)
Learning Objective: Compare the efficiency of monopolistic competition and perfect competition.

There are two important differences between the long-run equilibrium in a perfectly competitive industry and a monopolistically competitive industry. Unlike perfectly competitive firms, monopolistically competitive firms charge a price greater than marginal cost, and they do not produce at minimum average total cost. Because price is greater than marginal cost, allocative efficiency is not achieved, and because price is greater than minimum average total cost, productive efficiency is not achieved. Monopolistically competitive firms also have excess capacity because they could produce at a lower average cost by increasing output. Despite these apparent inefficiencies, consumers benefit from purchasing products that are differentiated.
**Extra Solved Problem 13.4**

Supports Learning Objective 13.4: Compare the efficiency of monopolistic competition and perfect competition.

Luigi’s Italian Restaurant has the demand and revenue schedules below from Extra Solved Problem 13.1. Assume that the marginal costs for Luigi’s are as given in the last column of the table.

<table>
<thead>
<tr>
<th>Price</th>
<th>Quantity</th>
<th>Total Revenue</th>
<th>Marginal Revenue</th>
<th>Marginal Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>$26</td>
<td>30</td>
<td>$780</td>
<td>—</td>
<td>—</td>

<td>270</td>
<td>2,700</td>
<td>–6</td>
<td>40</td>
</tr>
</tbody>
</table>

a. Compare Luigi’s profit-maximizing condition with that of the perfectly competitive firm’s profit-maximizing condition. Explain the inefficiency caused by Luigi’s being a monopolistically competitive firm.

b. What do customers gain by participating in industries that are monopolistically competitive?

**Solving the Problem**

**Step 1: Review the chapter material.**

This problem is about monopolistic competition versus perfect competition, so you may want to review the section “Comparing Monopolistic Competition and Perfect Competition,” which begins on page 443 in the textbook.

**Step 2: Determine the profit-maximizing quantity for Luigi’s and the profit-maximizing quantity if Luigi’s was a perfectly competitive firm.**

Luigi’s will maximize profit where marginal revenue equals marginal cost. Marginal revenue and marginal cost equal $10 per pizza when 150 pizzas are produced and sold. Note that at the quantity of 150 pizzas, a price of $18 will be charged, which is greater than the marginal revenue and marginal cost of $10. A perfectly competitive firm will produce where marginal cost equals price. Price and marginal cost both equal $16 per pizza when 180 pizzas will be produced.

**Step 3: Compare the profit-maximization condition for Luigi’s and the perfectly competitive firm, while being sure to note the inefficiency that arises due to monopolistic competition.**

As a monopolistic competitor, Luigi’s charges a price of $18 per pizza, which is higher than the perfectly competitive price of $16. Luigi’s also produces only 150 pizzas, while a perfectly competitive firm that was producing where price equals marginal cost would produce 180 pizzas. We can conclude that Luigi’s, as a monopolistically competitive firm, has excess capacity and charges a price greater than its marginal cost.
Step 4: Discuss the gains to consumers that buy from monopolistically competitive firms.

Although consumers pay a higher price and cannot purchase as many units of the good when it is produced in a monopolistically competitive industry, they get to choose from a variety of products when making their consumption choices. The willingness of consumers to pay higher prices for differentiated goods indicates that consumers value these goods enough to be willing to pay the higher prices.

13.5 How Marketing Differentiates Products (pages 445–446)
Learning Objective: Define marketing and explain how firms use marketing to differentiate their products.

Firms can differentiate their products through marketing. Marketing refers to all the activities necessary for a firm to sell a product to a consumer. Firms use two marketing tools to differentiate their products:

1. Brand management refers to the actions of a firm intended to maintain the differentiation of a product over time. Economic profits are earned when a firm introduces a new product, but this leads to the entry of firms producing similar products, and the profits are eliminated. Firms use brand management to delay the time when they will no longer be able to earn profits.

2. Advertising shifts the demand curve for a product to the right and makes the demand curve more inelastic. Successful advertising allows the firm to sell more at every price. Advertising also increases costs. If the increase in revenue from advertising exceeds the costs, profits will rise.

Once a firm, such as Coca-Cola or Apple, has established a brand name, it has an incentive to defend it. Firms can apply for a trademark. A trademark grants legal protection against other firms using a product’s name. If firms do not prevent the unauthorized use of their trademarks, they may no longer be entitled to legal protection. Firms will spend substantial amounts of money to ensure that they do not lose legal protection for their trademarks.

Extra Solved Problem 13.5
We Came. We Marketed. We Sold.
Supports Learning Objective 13.5: Define marketing and explain how firms use marketing to differentiate their products.

The 3Com Corporation was incorporated in 1979 and specializes in providing computer network devices such as routers and network switches. Among 3Com’s clients are businesses that want to improve the communication and security capabilities of their computer systems. 3Com is not a household name in the manner of McDonald’s or Microsoft, but marketing is an important part of the company’s success. It faces stiff competition from other computer service providers, such as Cisco Systems, and uses advertising and trademarks to influence its customers. 3Com’s advertising efforts are aimed primarily at computer network managers; for example, an advertising agency developed a two-page ad for 3Com titled, “We Came. We Saw. We Routed.” Ads such as these are placed in publications most likely to be seen by the target audience. It would be less effective for 3Com to place ads in People or Time magazines, as few of their readers are computer network managers, than it would be to advertise in business publications. The importance of establishing and maintaining 3Com’s trademarks is indicated by the guidelines the firm’s legal experts issue to employees. The following is a sample of these guidelines for over forty company and product trademarks:
a. Define marketing and explain the importance of marketing to firms.

b. Explain how 3Com Corporation uses marketing to differentiate its products.

Solving the Problem

Step 1: Review the chapter material.
This problem is about how firms differentiate products, so you may want to review the section “How Marketing Differentiates Products,” which begins on page 445 in the textbook.

Step 2: Define marketing and explain the importance of marketing to firms.
Marketing refers to all the activities necessary for a firm to sell a product to a consumer. To earn profits, monopolistically competitive firms must differentiate their products. These firms use two marketing tools to do this: Brand management and advertising.

Step 3: Explain how 3Com Corporation uses marketing to differentiate its products.
3Com Corporation uses brand management, including extensive use of trademarks and advertising, to differentiate its products. 3Com Corporation focuses its marketing strategies on its customers; for example, computer network managers.

Extra Solved Problem 13.6
The Marketing Power of Oprah (or at least her best friend, Gayle)
Supports Learning Objective 13.6: Identify the key factors that determine a firm’s success

In August 2009, Oprah Winfrey and her best friend, Gayle King, attended the funeral service of Eunice Shriver in Hyannis, Massachusetts. While in town, Oprah and Gayle sampled a chicken pot pie that had been delivered to Oprah at her hotel. The following week, Gayle spent several minutes on her XM satellite radio show singing the praises of the pie that had been produced by the Centerville Pie Company in Centerville, Massachusetts. Within days of Gayle’s endorsement, sales of pies from the Centerville Pie Company rose from 30 per day to over 100 per day. While additional orders came in from all over the country, the Centerville Pie Company had no system for sending pies through the mail, and the company wasn’t even able to accept credit card payments. For a company that opened its doors only five months
earlier, the growth in demand, while welcome, presented additional challenges. Despite twelve-hour workdays for the company’s owners and employees, the company stated on its Web site in September 2009 that there was a ten-day wait for their pot pies, and pies were still only available for pickup directly from the store. As the owner of the Centerville Pie Company, Laurie Bowen, stated, “Bigger isn’t always better . . . I just don’t want the quality to suffer because of the quantity.”

a. What factors have contributed to the success of the Centerville Pie Company?

b. Which of these factors was under the company’s control and which were not?

Solving the Problem

Step 1: Review the chapter material.

This problem is about the factors that make a firm successful, so you may want to review the section “What Makes a Firm Successful?” that begins on page 446 in the textbook.

Step 2: Answer part (a) by determining what affected the profitability of the Centerville Pie Company.

According to its owner, The Centerville Pie Company focuses on making quality pies. The quality of its pies differentiates its product from competing products. Although this focus on quality may increase the average cost of production relative to competing firms, the higher quality helps to keep customer demand high. The focus on quality coupled with the public endorsement from Oprah’s best friend increased the demand for pies at the Centerville Pie Company. Whether the company is ultimately “successful” depends on its ability to respond to the sudden increase in demand without losing the quality that differentiates its product from the products of its competitors.

Step 3: Answer part (b) by considering what factors the Centerville Pie Company can control and what factors are outside of its control.

The Centerville Pie company can control its own costs and the quality of the pies it produces. However, it cannot control the words of Gayle King on her radio show. Gayle’s endorsement of Centerville Pie Company pies created value relative to competitors that the company itself did not directly control.

Key Terms

**Brand management** The actions of a firm intended to maintain the differentiation of a product over time.

**Marketing** All the activities necessary for a firm to sell a product to a consumer.

**Monopolistic competition** A market structure in which barriers to entry are low and many firms compete by selling similar, but not identical, products.

Self-Test

(Answers are provided at the end of the Self-Test.)

Multiple-Choice Questions

1. Fill in the blanks. The monopolistically competitive firm sells _______ product and faces _______ demand curve.
   a. a differentiated; a horizontal
   b. a homogeneous; a downward-sloping
   c. a differentiated; a downward-sloping
   d. a homogeneous; a horizontal

2. A monopolistic competitive market is characterized by
   a. low barriers to entry.
   b. many firms producing differentiated products.
   c. both (a) and (b).
   d. none of the above.

3. Refer to the graph below. According to this graph, what will happen if Starbucks increases the price of caffè lattes?

   ![Graph](image)

   a. It will not lose any customers.
   b. It will lose all of its customers.
   c. It will lose some, but not all, of its customers.
   d. It will gain customers.

4. For what type of market structure is the demand curve the same as marginal revenue?
   a. monopolistic competition
   b. perfect competition
   c. both monopolistic and perfect competition
   d. neither monopolistic nor perfect competition
5. If marginal revenue slopes downward, which of the following is true?
   a. The firm must decrease its price to sell a larger quantity.
   b. The firm must increase its price to sell a larger quantity.
   c. The firm must decrease its price if it wants to continue selling the same quantity.
   d. The firm is unable to adjust price when the quantity sold changes.

6. Which of the following measures is conceptually the same as price?
   a. marginal revenue
   b. total revenue
   c. average revenue
   d. none of the above

7. Which of the following terms best describes the additional revenue associated with selling an additional unit of output?
   a. price
   b. average revenue
   c. marginal revenue
   d. total revenue

8. When a monopolistically competitive firm decreases price, good and bad things happen. Which of the following is considered a good thing for the firm?
   a. the price effect
   b. the output effect
   c. the revenue effect
   d. all of the above

9. When a monopolistically competitive firm decreases price, good and bad things happen. Which of the following is considered a bad thing for the firm?
   a. the price effect
   b. the output effect
   c. the revenue effect
   d. all of the above

10. Fill in the blanks. For a monopolistically competitive firm, its demand curve is________, and its marginal revenue curve is________.
    a. horizontal; horizontal
    b. downward sloping; downward sloping
    c. horizontal; downward sloping
    d. downward sloping; horizontal
11. Refer to the table below. What is the average revenue associated with the sixth unit of output produced and sold?

<table>
<thead>
<tr>
<th>Caffé Lattes Sold per Week (Q)</th>
<th>Price (P)</th>
<th>Total Revenue (TR=P x Q)</th>
<th>Average Revenue</th>
<th>Marginal Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>$4.00</td>
<td>$16.00</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>3.50</td>
<td>17.50</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>3.00</td>
<td>18.00</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. $3.00  
b. $2.00  
c. $0.50  
d. None of the above; there is insufficient information to answer the question.

12. Refer to the table below. What is the marginal revenue associated with the sixth unit of output produced and sold?

<table>
<thead>
<tr>
<th>Caffé Lattes Sold per Week (Q)</th>
<th>Price (P)</th>
<th>Total Revenue (TR=P x Q)</th>
<th>Average Revenue</th>
<th>Marginal Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>$4.00</td>
<td>$16.00</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>3.50</td>
<td>17.50</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>3.00</td>
<td>18.00</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. $3.00  
b. $2.00  
c. $0.50  
d. None of the above

13. Refer to the graph below. A decrease in price from $3.50 to $3.00 per cup results in a gain and a loss of revenue. Which area represents the loss of revenue?

![Graph showing areas of revenue loss](image)

a. area A  
b. area B  
c. Areas A and B both represent revenue losses.  
d. an area not shown
14. Refer to the graph below. A decrease in price from $3.50 to $3.00 per cup results in a gain and a loss of revenue. Which area represents the revenue gain?

a. area A
b. area B
c. Both shaded areas represent revenue gains.
d. an area not shown

15. If a firm has the ability to affect the price of the good or service it sells, what is the relationship between its marginal revenue curve and its demand curve?
   a. The firm will have a marginal revenue curve that is above its demand curve.
   b. The firm will have a marginal revenue curve that is below its demand curve.
   c. The firm will have a marginal revenue curve that is the same as its demand curve.
   d. The firm will have an upward-sloping marginal revenue curve and a downward-sloping demand curve.

16. Refer to the graph below. The loss in revenue from decreasing price is greater than the gain in revenue from increasing price whenever

a. marginal revenue is positive.
b. marginal revenue is negative.
c. marginal revenue equals demand.
d. demand has a negative slope.
17. Which of the following types of firms use the marginal revenue equals marginal cost approach to maximize profits?
   a. perfectly competitive firms
   b. monopolistically competitive firms
   c. both perfectly competitive and monopolistically competitive firms
   d. neither perfectly competitive nor monopolistically competitive firms

18. What is marginal cost?
   a. the cost per unit of output produced
   b. the increase in total cost resulting from producing one more unit of output
   c. the impact of additional output on total fixed cost
   d. the cost of production that is independent of the level of output produced

19. Refer to the graph below. In order to maximize profit, what price should the firm charge?

![Graph of Demand, Marginal Revenue (MR), Average Total Cost (ATC), and Marginal Cost (MC)]

   a. $18
   b. $15
   c. $8
   d. $4

20. Refer to the graph below. Assume that the firm is producing 600 units. What should the firm do in order to maximize profit?

![Graph of Demand, Marginal Revenue (MR), Average Total Cost (ATC), and Marginal Cost (MC)]

   a. The firm should increase output, because at 600 units, price is above marginal cost.
   b. The firm should maintain output at 600 units, because at this output level, marginal revenue is greater than marginal cost, marginal cost is minimized, and price is the highest.
   c. The firm should increase the level of output, because at 600 units, marginal revenue is greater than marginal cost.
   d. The firm should increase the level of output until it reaches the minimum average total cost.
21. Refer to the graphs below. Assuming both firms are producing five cups per week, which firm is maximizing profits?

- the firm on the left
- the firm on the right
- both firms
- neither firm

22. Refer to the graph below. Assume that the firm represented by the cost and demand curves below is maximizing profit. Which area represents the formula: \((P - ATC) \times Q\)?

- area \(A\)
- area \(B\)
- area \(A + area B\)
- area \(B - area A\)
23. Refer to the graph below. Assume that the firm represented by the cost and demand curves below is maximizing profit. The value of profits is

![Graph showing cost and demand curves]

a. $17.50.
b. $12.50.
c. $5.00.
d. None of the above; that information cannot be obtained from this graph.

24. Refer to the table below. When is average total cost minimized?

<table>
<thead>
<tr>
<th>Cups Sold per Week (Q)</th>
<th>Price (P)</th>
<th>Total Revenue (TR)</th>
<th>Marginal Revenue (MR)</th>
<th>Total Cost (TC)</th>
<th>Marginal Cost (MC)</th>
<th>Average Total Cost (ATC)</th>

a. 1 unit of output
b. 5 units of output
c. 6 units of output
d. 10 units of output

26. Refer to the graphs below. Which firm is a monopolistic competitor operating in the long run?

a. the firm on the left
b. the firm on the right
c. both firms
d. neither firm

27. How does the entry of new coffeehouses affect the profits of existing coffeehouses?
   a. Entry will increase the profits of existing coffeehouses by shifting the market demand curve for coffee to the right.
   b. Entry will increase the profits of existing coffeehouses by shifting each of their individual demand curves to the right.
   c. Entry will decrease the profits of existing coffeehouses by shifting each of their individual demand curves to the left and making the demand curves more elastic.
   d. Entry will not affect the profits of existing coffeehouses.
28. Suppose you invest $200,000 in a business. The return you could earn each year on a similar investment using that money is 10 percent, or $20,000. In an economic sense, the $20,000 is
   a. an economic cost.
   b. economic profit.
   c. an accounting cost.
   d. both economic profit and accounting profit.

29. A monopolistically competitive firm produces where
   a. marginal revenue equals marginal cost.
   b. price equals marginal cost.
   c. total revenue equals total cost.
   d. None of the above is true.

30. At the profit-maximizing level of output, a monopolistically competitive firm produces where
   a. price is less than marginal cost.
   b. price is greater than marginal cost.
   c. price equals marginal cost.
   d. None of the above is true.

31. If a monopolistically competitive firm’s demand curve is above its average total cost curve, then this firm is making
   a. zero economic profit.
   b. negative economic profit.
   c. positive economic profit.
   d. none of the above.

32. If a monopolistically competitive firm is earning positive economic profit in the short run, then new firms enter the market in the long run and its demand curve
   a. shifts to the right.
   b. shifts to the left.
   c. stays the same.
   d. does none of the above.

33. A monopolistically competitive firm in a long-run equilibrium produces where
   a. its demand curve is above its average total cost curve.
   b. its demand curve is below its average total cost curve.
   c. its demand curve is tangent to its average total cost curve.
   d. None of the above is true.
34. Refer to the graphs below. Which graph depicts a situation in which some firms will exit the industry?

![Graphs](image)

a. the graph on the left  

b. the graph in the middle  

c. the graph on the right  

d. none of the above

35. Refer to the graphs below. Which graph best depicts the relationship between price and average total cost in the long run for a monopolistically competitive firm?

![Graphs](image)

a. the graph on the left  

b. the graph in the middle  

c. the graph on the right  

d. none of the above

36. Refer to the graphs below. Which graph best depicts the profit or loss situation for a monopolistically competitive firm in the long run?

![Graphs](image)

a. the graph on the left  

b. the graph in the middle  

c. the graph on the right  

d. none of the above
37. Refer to the graphs below. Which graph best depicts a firm in a monopolistically competitive industry that has an incentive to exit the industry in the long run?

![Graphs](image)

a. the graph on the left  
b. the graph in the middle  
c. the graph on the right  
d. none of the above

38. Refer to the graphs below, which represent the situations facing typical firms in three different monopolistically competitive industries. Which graph best represents the situation where new firms are likely to enter the industry?

![Graphs](image)

a. the graph on the left  
b. the graph in the middle  
c. the graph on the right  
d. none of the above
39. Refer to the graph below. Assuming the computer industry is monopolistically competitive, which set of demand and marginal revenue curves for a typical firm is more consistent with long-run equilibrium in the computer industry?

![Graph showing demand and marginal revenue curves](image)

a. $D_1$ and $MR_1$
b. $D_2$ and $MR_2$
c. $D_1$ and $MR_2$
d. $D_2$ and $MR_1$

40. Is zero economic profit inevitable in the long run for a monopolistically competitive firm?
   a. Yes, there is nothing the firm can do to avoid zero economic profit in the long run.
   b. No, a firm could try to continue making a profit in the long run by producing a product identical to those of competing firms.
   c. No, a firm could try to continue making a profit in the long run by reducing production costs and improving its products.
   d. No, a firm could try to continue making a profit in the long run by simply offering goods that are cheaper to produce, even if they have less value than those offered by competing firms.

41. Refer to the graphs below. Which points on the graph coincide with productive efficiency?

![Graph showing price and cost relationships](image)

a. point A on both graphs
b. point B on the graph on the right
c. point C on the graph on the right
d. points A, B, and C on the graph on the right
42. Refer to the graph below. Which level of output indicates excess capacity?

![Graph showing price, cost, and quantity]

a. $Q_1$
b. $Q_2$
c. both $Q_1$ and $Q_2$
d. neither $Q_1$ nor $Q_2$

43. Which type of efficiency is achieved by a monopolistically competitive firm in the long run?
   a. allocative efficiency
   b. productive efficiency
   c. both allocative and productive efficiency
   d. neither allocative nor productive efficiency

44. Fill in the blanks. A monopolistically competitive firm produces where _________ while a perfectly competitive firm produces where _________.
   a. price equals to marginal cost; price is higher than marginal cost
   b. price is higher than marginal cost; price equals to marginal cost
   c. price is less than marginal cost; price equals to marginal cost
   d. price is greater than marginal cost; price is less than marginal cost

45. Fill in the blanks. In long-run equilibrium, a monopolistically competitive firm’s level of output is _________ while a perfectly competitive firm’s level of output is _________.
   a. above its minimum average total cost; at its minimum average total cost.
   b. at its minimum average total cost; above its minimum average total cost.
   c. above its minimum average total cost; above its minimum average total cost.
   d. at its minimum average total cost; at its minimum average total cost.

46. What trade-offs do consumers face when buying a product from a monopolistically competitive firm?
   a. Consumers pay a lower price but also have fewer choices.
   b. Consumers pay a price greater than marginal cost but also have choices more suited to their tastes.
   c. Consumers pay a higher price but are happy knowing that the industry is highly efficient.
   d. Consumers pay a price as low as the competitive price but have difficulty finding and buying the product.

47. What is the term given to all the activities necessary for a firm to sell a product to a consumer?
   a. brand management
   b. advertising
   c. marketing
   d. product differentiation
48. What is the term given to the actions of a firm intended to maintain the differentiation of a product over time?
   a. brand management
   b. advertising
   c. marketing
   d. campaigning

49. Which of the following statements is correct?
   a. Brand names can be easily protected, especially as time goes by.
   b. Legally enforcing trademarks can be difficult.
   c. Establishing franchises is the best strategy to protect a firm’s brand name.
   d. All of the above are correct.

50. Refer to the figure below. Which of the following terms is missing in the box on the right?

   a. brand management
   b. marketing
   c. profitability
   d. demand

**Short Answer Questions**

1. Your friend argues that because a monopolistically competitive firm produces a differentiated product, it faces a downward-sloping demand and marginal revenue curves, and its marginal revenue curve is below its demand curve. Comment on this argument.

   ________________________________________________________________
   ________________________________________________________________
   ________________________________________________________________
   ________________________________________________________________
2. What is the most important characteristic that perfectly competitive and monopolistically competitive firms have in common?

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

3. Why is it not possible for a monopolistically competitive firm to produce at minimum average total cost in long-run equilibrium?

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

4. How do consumers benefit from monopolistic competition?

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

5. Why does the long-run equilibrium for a monopolistically competitive firm occur when economic profit is zero?

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

True/False Questions

T F  1. In monopolistic competition, marginal revenue is less than the price.

T F  2. A firm’s profit equals the total quantity sold times the difference between the price of the product and total cost.

T F  3. Monopolistically competitive firms charge a price greater than marginal cost in both the short and long run.

T F  4. In monopolistic competition, average revenue is less than the price.

T F  5. Unlike perfectly competitive firms, monopolistically competitive firms earn long-run profits.
T F 6. When some firms exit a monopolistically competitive market, the demand curves of firms that remain become less elastic.
T F 7. Among the factors that make a firm successful but are not under its control is the ability to differentiate its product.
T F 8. If the average total cost curve is above the demand curve, then this monopolistic competitive firm is having economic losses.
T F 9. Brand management refers to all activities necessary for a firm to sell a product to a consumer.
T F 10. Because consumers pay a price above marginal cost in a monopolistically competitive market, they are better off than they would be in a competitive market.
T F 11. Unlike perfectly competitive firms, monopolistically competitive firms have excess capacity.
T F 12. A monopolistically competitive firm can be in long-run equilibrium and having positive economic profit.
T F 13. A monopolistically competitively firm achieves productive efficiency but not allocative efficiency.
T F 14. Firms use brand management to postpone the time when they will no longer be able to earn economic profits.
T F 15. One motive for advertising is to make the demand for a product more elastic so that when price is lowered, there will be a greater increase in quantity demanded.

<td>If the computer industry is monopolistically competitive, then in the long run the typical firm’s demand curve will be tangent to its average cost curve and economic profit will equal zero.</td>
</tr>
<tr>
<td>Question</td>
<td>Answer</td>
<td>Comment</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>---------</td>
</tr>
<tr>
<td>40.</td>
<td>c</td>
<td>Firms try to continue earning profits by reducing the cost of producing their products, by improving their products, or by convincing consumers that their products are different from what competitors offer. To stay one step ahead of its competitors, a firm must offer consumers goods or services that they perceive to have greater value than those offered by competing firms.</td>
</tr>
<tr>
<td>41.</td>
<td>a</td>
<td>At point A on both graphs, the firms produce where average total cost is at a minimum. When this happens, the firms are productively efficient.</td>
</tr>
<tr>
<td>42.</td>
<td>a</td>
<td>The monopolistically competitive firm has excess capacity equal to the difference between its profit-maximizing level of output and the productively efficient level of output.</td>
</tr>
<tr>
<td>43.</td>
<td>d</td>
<td>In a perfectly competitive market, both productive efficiency and allocative efficiency are achieved, but in a monopolistically competitive market, neither is achieved.</td>
</tr>
<tr>
<td>44.</td>
<td>b</td>
<td>For monopolistic competition, the profit maximizing level of output is where $MR = MC$. Since $P &gt; MR$ for a monopolistically competitive firm, then $P &gt; MC$. For perfect competition, the profit maximizing level of output is where $MR = MC$. Since $P = MR$, then $P = MC$.</td>
</tr>
<tr>
<td>45.</td>
<td>a</td>
<td>The long-run equilibrium in both monopolistic competition and perfect competition is achieved where $P = ATC$. Since the demand curve facing a monopolistically competitive firm is downward sloping, this level of output will not be at its minimum ATC, it will be above it. For a perfectly competitive firm, this level of output is at its minimum ATC.</td>
</tr>
<tr>
<td>46.</td>
<td>b</td>
<td>Consumers face a trade-off when buying the product of a monopolistically competitive firm: They are paying a price that is greater than marginal cost, and the product is not being produced at minimum average cost, but they benefit from being able to purchase a product that is differentiated and more closely suited to their tastes.</td>
</tr>
<tr>
<td>47.</td>
<td>c</td>
<td>Firms can differentiate their products through marketing. Marketing refers to all the activities necessary for a firm to sell a product to a consumer.</td>

<tr>
<td>48.</td>
<td>a</td>
<td>The actions of a firm intended to maintain the differentiation of a product over time are called brand management.</td>
</tr>
<tr>
<td>49.</td>
<td>b</td>
<td>Legally enforcing trademarks can be difficult. Estimates are that each year U.S. companies lose hundreds of billions of dollars of sales worldwide as a result of unauthorized use of their trademarked brand names. U.S. companies have often found it difficult to enforce their trademarks in the courts of some foreign countries.</td>
</tr>
<tr>
<td>50.</td>
<td>c</td>
<td>The factors under a firm’s control—the ability to differentiate its product and the ability to produce it at lower cost—combine with the factors beyond its control to determine the firm’s profitability.</td>
</tr>
</tbody>
</table>

**Short Answer Responses**

1. Your friend is correct. The monopolistically competitive firm has to lower the price in order to sell more, so it faces a downward-sloping demand curve. Since the lower price applies to all the previous units that could have been sold at higher price, the marginal revenue curve is downward sloping, and marginal revenue is less than the price. Therefore the MR curve is below the demand curve.
2. Low entry barriers are common to both market structures, so firms can easily enter and exit the industry. Ease of entry and exit ensures that firms earn zero economic profits in the long run.

3. The entry and exit of firms ensures that monopolistically competitive firms will earn zero economic profits in the long run. For this to be true, price must equal average total cost. This, in turn, requires a firm’s demand curve to be tangent to its average total cost curve. Because the firm’s demand curve is downward sloping, this tangency must be to the left of the minimum point on the average total cost curve.

4. Although consumers pay a price that is greater than the marginal cost of production, they benefit from being able to purchase a product that is differentiated and more closely suited to their tastes.

5. Since there are low barriers to entry, long-run equilibrium occurs when economic profit is zero. If firms are making positive economic profit in the short run, new firms will enter the market in the long run causing the demand curve facing an established firm to decrease (and becomes more elastic) and the price to fall until it wipes out all the positive economic profit. The opposite is true if the firm is making negative economic profit.

**True/False Answers**

<tbody>
<tr>
<td>1. In monopolistic competition, for the firm to sell more, it has to reduce the price. The reduced price applies to all the previous units that could have been sold at higher price. Therefore, MR is less than the price.</td>
<td>T</td>
<td></td>
</tr>
<tr>
<td>2. A firm’s profit equals the total quantity sold times the difference between the price of the product and average total cost.</td>
<td>F</td>
<td></td>
</tr>
<tr>
<td>3. The firm has downward-sloping demand and marginal revenue curves, and the marginal revenue curve lies below the demand curve. The firm will choose to produce where the marginal revenue intersects the marginal cost and then choose the price to charge by going up to the demand curve and charging the consumers’ willingness to pay at that quantity.</td>
<td>T</td>
<td></td>
</tr>
<tr>
<td>4. AR always equals the price. ( AR = TR / Q = PQ / Q = P ).</td>
<td>F</td>
<td></td>
</tr>
<tr>
<td>5. Low barriers to entry mean firms will enter and exit until economic profit equals zero.</td>
<td>F</td>
<td></td>
</tr>
<tr>
<td>6. When firms exit, the demand curves for remaining firms shift to the right and become less elastic.</td>
<td>T</td>
<td></td>
</tr>
<tr>
<td>7. The ability to differentiate its product is under the firm’s control.</td>
<td>F</td>
<td></td>
</tr>
<tr>
<td>8. When ATC curve is above the demand curve, then ( ATC &gt; P ) and this means a negative economic profit.</td>
<td>T</td>
<td></td>
</tr>
<tr>
<td>9. This is the definition of marketing. Brand management is the action of the firm intended to maintain the differentiation of a product over time.</td>
<td>F</td>
<td></td>
</tr>
<tr>
<td>10. Production in monopolistically competitive markets is inefficient, but consumers may be better off because monopolistic competition offers a variety of differentiated products.</td>
<td>F</td>
<td></td>
</tr>
<tr>
<td>11. Because the quantity a monopolistically competitive firm produces is less than the quantity at the minimum average total cost, the firm has excess capacity.</td>
<td>T</td>
<td></td>
</tr>
<tr>
<td>12. In the long run, the monopolistically competitive firm earns zero, not positive, economic profit.</td>
<td>F</td>
<td></td>

<td>Question</td>
<td>Answer</td>
<td>Comment</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>---------</td>
</tr>
<tr>
<td>13.</td>
<td>F</td>
<td>A monopolistically competitive firm achieves neither productive nor allocative efficiency since it does not produce at the minimum ATC and the price is greater than MC.</td>
</tr>
<tr>
<td>14.</td>
<td>T</td>
<td>Product differentiation and brand management help firms maintain economic profit.</td>
</tr>
<tr>
<td>15.</td>
<td>F</td>
<td>One motive for advertising is to make the demand for a product <em>less</em> elastic so that if price is raised, quantity demanded will not fall as much as it would without advertising.</td>
